

Box color explanation

- Method of class: HotelApp (Main menu)
- Method of class: HotelLogistics??
- Not necessarily a new method
- Undecided if to use

Indicates a function/method that already exists at some place in the program, and a reference to that method . Might be a better idea to invoke the existing method, than create duplicate methods that does the same thing. OBS! Be careful with the return addresses if invoke method from other part of program.

References: ex 4.1. includes everything that starts with 4.1.x.x.

Note: 3.1.1. is very similar to 2.2. but might be better to still have these duplicated.

Thoughts:

- Last minute booking (nu-> en vecka)
- Check in / check out? (at admin level) (Booking/Customer)
- List of available rooms? ( in rooms/bookings; as in "available at the moment?", or; Enough to have the search function in booking to find available rooms for specific time??)
- From admin -> Bookings: Edit booking info, more than remove?
- From admin -> customer: Also be able to make booking?
- From customer: Be able to cancel account?

Features to put in first report:

- Menu class
- HotelLogistics class(?)
- Account class
- Booking class
- Room class
- Join account and room into booking
- Fetch booking(s) from customer
- Fetch booking(s) from room

Note: 3.3.3. is very similar to 4.2 but 3.3.3. includes all bookings, and not just one customer's
